EDUCATION

University of California, San Diego, La Jolla, California USA

Ph.D. Student, Computer Science, September 2017 - December 2022 (anticipated)
• Advisor: Prof. Arun Kumar

Nankai University, Tianjin, China

B.S., Theoretical Physics, June 2016
• Advisor: Prof. Xueqian Li and Prof. Yangang Miao

RESEARCH INTERESTS

Machine learning systems, including systems powered by applied ML that enable novel applications, and systems designed for ML to make data science easier and faster

HONORS AND AWARDS

Best Thesis Award, School of Physics, Nankai University, 2016
Wang Kechang Scholarship for Academic Distinction, 2014
Gong-Neng Scholarship, 2013
Poling Academy Scholarship, 2012-2016

PROJECTS

Distributed Deep Learning on Data Systems:

Deep learning (DL) is growing in popularity for many data analytics applications, including among enterprises. Large business-critical datasets in such settings typically reside in RDBMSs or other data systems. The DB community has long aimed to bring machine learning (ML) to DBMS-resident data. Given past lessons from in-DBMS ML and recent advances in scalable DL systems, DBMS and cloud vendors are increasingly interested in adding more DL support for DB-resident data. In this paper, we show that there is no single “best” approach to achieve that goal and an interesting tradeoff space of approaches exists. We explain four canonical approaches, compare them analytically on multiple criteria (e.g., runtime efficiency and ease of governance) and compare them empirically with large-scale DL workloads. Our experiments and analyses show that it is non-trivial to meet all practical desiderata well and there is a Pareto frontier; for instance, some approaches are 3x-6x faster but fare worse on governance and portability. Our results and insights can help DBMS and cloud vendors design better DL support for DB users.

Open-sourced release: <https://github.com/makemebitter/cerebro-ds>

Cerebro:

Cerebro is a layered data platform for scalable deep learning. One of the biggest challenges for scalable deep learning is model selection, which is difficult and resource-heavy. This system provides high-level APIs for deep learning model selection and optimizes distributed deep learning training for model selection workloads. It adopts a new form of parallelism called Model Hopper Parallelism (MOP) and is the resource-optimal choice. It can expedite distributed deep learning training by 3x-10x compared to Horovod and TensorFlow Parameter Server. There are also subsequent works about bridging data systems (such as Apache Spark, Distributed databases, etc.) with distributed DL systems.

Project homepage: <https://adalabucsd.github.io/cerebro.html>

Open-sourced release: <https://adalabucsd.github.io/cerebro-system>

Panorama:

Panorama is a video querying system for object detection and classification. It is designed to tackle the life-long learning or bounded vocabulary issues. Computer-vision-based video analytics systems often require *update* of the vocabulary as new classes/labels need to be added from time-to-time. Such updates involve re-training of the deep learning model, which requires expertise and is very time-consuming. Panorama is built to partially avoid and automate this process while expediting inference speed at the same time.

Open-sourced release: <https://github.com/makemebitter/Panorama-UCSD>

RESEARCH IMPACT	Cerebro and MOP integrated into Greenplum Database and shipped by VMware	2019
	Code of Cerebro integrated into Apache MADlib project	2019

ACADEMIC EXPERIENCE

University of California, San Diego, La Jolla, California USA

PhD Student

Sept 2017 - present

Includes current Ph.D. research, Ph.D. and Masters level coursework and research/consulting projects.

Courses taken: Machine Learning, Data Mining & Analytics, Advanced Data Analytics, Computer Vision, Database Systems, Advanced Algorithms, Advanced Compilers, Principles of Programming Languages, Introduction to Robotics

Teaching Assistant for CSE234: Data Systems for Machine Learning

Winter 2021

Helped designing and supervising a research-oriented course on machine learning systems. Mentored 12 master students with their course projects ranging from advanced implementation of cutting-edge research, to evaluation and surveying the state-of-art, to open-ended research questions.

Teaching Assistant for DSC102: Systems for Scalable Analytics

Winter 2020

Developed the first edition of course assignments and auto-grading programs with Python and Bash. The assignments involve Python Dask, Spark, AWS EC2/S3/EBS, and Kubernetes. These assignments have been adopted by the course ever since and used by 500+ students.

Texas A&M University, College Station, Texas USA

Research Intern

Summer 2015

Worked on vision-based object tracking and data analysis & modeling.

Institute of Physics, Chinese Academy of Sciences, Beijing, China

Research Intern

Summer 2014

Research in theoretical physics.

Nankai University, Tianjin, China

Research Assistant

2013 - 2016

Research in theoretical physics.

PROFESSIONAL EXPERIENCE

Microsoft Gray System Lab, California USA

Research Intern

Summer 2021

Worked on machine learning system research, focusing factorized in-DBMS machine learning.

VMware, Palo Alto, California USA

Software Engineer Intern

Summer 2019

Worked on the first in-DBMS deep learning system, allowing training and inference of deep learning models with TensorFlow on database-resident data. Integrated my research project, Cerebro, into the deep learning training infrastructure of Greenplum Database, boosting efficiency by over 10x. Contributed to the Apache MADlib project in Python and SQL. Lead the development of a major release. This project has been incorporated into Greenplum and production-ready for VMware's customers.

Opera Solutions, San Diego, California USA

Data Scientist Intern

Summer 2018

Worked on a theatre scheduling & recommender system. Proposed new models and optimized the existing system.
